Image regions — TikZ / table / failed-math candidates

Regions MathPix left as images (no LaTeX). The Source column names the `tex.zip` file whose filename region 5-tuple (page, height, width, top_left_y, top_left_x) equals this row's — an exact key match, not a guess. Naming the file does NOT say its `tikzpicture` or `tabular` renders to what is on the page; that is a separate question. Reconstruct with `pdfdrill vision`; verify against the real ink with inkdrill.
