mielke-geometrodynamics_131 DIA_0009 131 — — —					 A diagram illustrating a spacetime foliation. It shows a curved, light-blue hypersurface representing a slice of spacetime. A normal vector n is shown pointing upwards from the surface. The surface is labeled Σ_t and Σ_{t+dt}, indicating a time evolution.
mielke-geometrodynamics_200 DIA_0010 200 — — —					 A diagram illustrating a spacetime foliation. It shows a curved, light-blue hypersurface representing a slice of spacetime. A normal vector n is shown pointing upwards from the surface. The surface is labeled Σ_t and Σ_{t+dt}, indicating a time evolution.
mielke-geometrodynamics_226 DIA_0011 226 — — —					 A diagram illustrating a spacetime foliation. It shows a curved, light-blue hypersurface representing a slice of spacetime. A normal vector n is shown pointing upwards from the surface. The surface is labeled Σ_t and Σ_{t+dt}, indicating a time evolution.

mielke-geometrodynamics PIC_0003 359 — —					The plot shows the mass M in MeV on the vertical axis (ranging from 1000 to 2500) against a parameter on the horizontal axis (ranging from $\frac{1}{2}$ to 3). Various baryon states are plotted, including ground states and excited states. A legend in the top left corner identifies the symbols: $\bullet \Omega$, $\bullet \Xi$, $\bullet \Sigma$, $\bullet \Lambda$, $\bullet N, \Delta$ for ground states, and $\bullet \Sigma^*$, $\bullet \Lambda^*$, $\bullet N^*$ for excited states. A bracket groups the ground states under 'Black soliton mass formula' and the excited states under 'parity baryons'.
