mielke-geometrodynamics_32 DIA_0003	32	—	—	—	A diagram of a sphere with a tangent plane. A point m is on the plane. A vector $\frac{\partial}{\partial \theta}$ points upwards from m. A vector $\frac{\partial}{\partial \phi}$ points to the right from m. A vector $\frac{\partial}{\partial \theta}$ is also shown on the sphere's surface. A vector Δe is shown at the top of the sphere. A vector $e(o)$ is shown at the top of the sphere. A vector U is shown inside the sphere. A vector $G = \partial U$ is shown on the sphere's surface.
mielke-geometrodynamics_36 DIA_0004	36	—	—	—	A diagram of a torus. A vector field $F_m : \pi^{-1}(m)$ is shown. A vector δ is shown. A vector π is shown. A vector $U \subset M \approx S^1$ is shown. A point m is shown.
mielke-geometrodynamics_40 DIA_0005	40	—	—	—	A diagram showing three vertical ellipses. The middle ellipse has a point p and a vector H_p pointing to the right. A vector V_p points downwards from p. The bottom of the middle ellipse is labeled m. The bottom of the rightmost ellipse is labeled M. A vector $F_m \approx G$ is shown at the top.

mielke-geometrodynamics PIC_0003 359 — —					The plot shows the mass M in MeV on the vertical axis (ranging from 1000 to 2500) against a parameter on the horizontal axis (ranging from $\frac{1}{2}$ to 3). Various baryon states are plotted, including ground states and excited states. A legend in the top left corner identifies the symbols: $\bullet \Omega$, $\bullet \Xi$, $\bullet \Sigma$, $\bullet \Lambda$, $\bullet N, \Delta$ for the 'Black soliton mass formula', and $-\bullet$ for 'parity baryons'. The plot shows a general upward trend in mass as the parameter increases, with some states branching or splitting.
