mielke-geometrodynamics_131 DIA_0009 131 — — —					 A diagram illustrating a spacetime foliation. It shows a curved, light-blue hypersurface representing a spatial slice at time t, labeled Σ_t. Above it, another similar hypersurface is shown at time $t+dt$, labeled Σ_{t+dt}. A vertical arrow labeled n indicates the normal vector to the hypersurface Σ_t.
mielke-geometrodynamics_200 DIA_0010 200 — — —					 A diagram illustrating a wormhole geometry. It shows two flared, blue, funnel-like regions connected by a narrow, central throat. The surfaces are represented by a grid of lines, and the color gradient transitions from blue at the edges to purple in the center of the throat.
mielke-geometrodynamics_226 DIA_0011 226 — — —					 A diagram illustrating a 3D grid structure, likely representing a discretized spacetime. The grid is composed of many small cubes. A blue square loop is highlighted on the top surface of the grid, indicating a specific path or boundary.

mielke-geometrodynamics PIC_0003 359					The plot shows the mass M in MeV on the vertical axis (ranging from 1000 to 2500) against a parameter on the horizontal axis (ranging from $\frac{1}{2}$ to 3). Various baryon states are plotted, including ground states and excited states. A legend in the top left corner identifies the symbols: $\bullet \Omega$, $\bullet \Xi$, $\bullet \Sigma$, $\bullet \Lambda$, $\bullet N, \Delta$ for the 'Black soliton mass formula', and $\text{---} \bullet$ for 'parity baryons'. The plot shows a general upward trend in mass as the parameter increases, with some states branching or splitting.
